I implemented the minus and typeCheck methods. I assisted with the project, join, and union methods. Minus creates a new list and adds each tuple from table1, but it does not add that tuple if it is in table2. TypeCheck checks if the given tuple has the same amount of attributes as this.tuple and also checks if each attribute is of the same type; it returns false if not and true otherwise. In project, join, and union, I checked for errors in syntax and logic, correcting several of them, such as incorrect variable names or out of bounds exceptions.
